

The module substantially improves the shipping management, introducing the following possibilities not present in the standard shipping functions.

- enter new shipments directly, overcoming the need to switch from the sales order
- complete row management (similar to all other documents in Dolibarr)
- possibility of sending material and generating the transfer document also for suppliers and not only for customers (returns to suppliers, sending to subcontractors for processing, ...)
- material transfer between 2 warehouses (internal management of the warehouse on behalf of contractors, ...)

All other functions (invoicing from shipment, management of statuses, printing of documents,) reflect those of shipments (*).

1) Module configuration

The module has no parameters

2) Usage

Upon installation, a new item is added to the main menu.

From this you access the list of shipments (only generated by the module), the remaining operation is the standard Dolibarr one.

On the other hand, by accessing the list of standard shipments, all shipments (advanced and not) will be displayed.

(*) the only difference lies in the fact that, when switching from shipment to invoice, all shipment lines will be transferred to the invoice, regardless of the selection made. This depends on unfortunately unsolvable technical reasons
